Sexual Development

Hormonal Control of Sexual Behavior

Neural Control of Sexual Behavior

Pair Bonding and Parental Behavior

# Chapter 10: Reproductive Behavior

## **Sexual Development**

Hormonal Control of Sexual Behavior

Neural Control of Sexual Behavior

Pair Bonding and Parental Behavior

# Sexual Development

## The Roles of Genes.

- anatomical sex: physical characteristics
- chromosomal sex = XX or XY
- gonadal sex: presence of testes or ovaries
- gender role = typical dimorphic sets of behaviors
- gender identity = sense of belonging to male or female sex
- sexual orientation = attraction to same or opposite sex, or both
- gender identity can be distinct from sexual orientation

# Sexual Development

## The Roles of Genes.

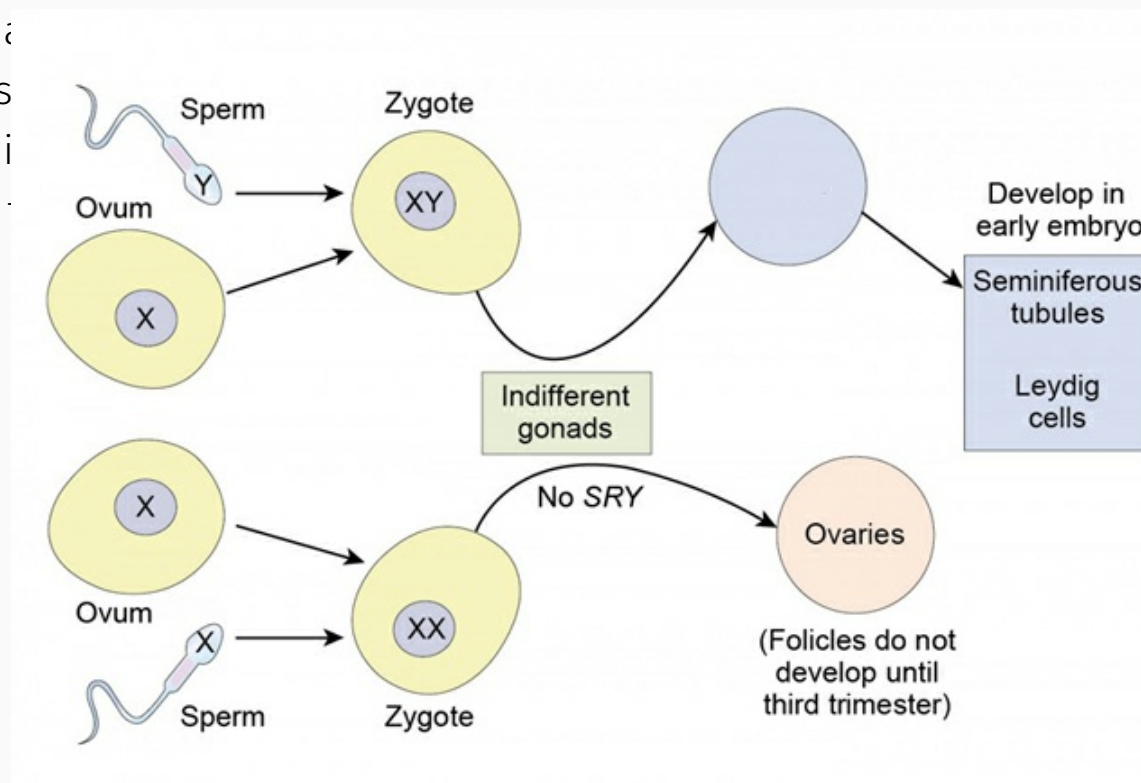

- some sex differences arise from genes
- others from expression of genes on the

# Sexual Development

## Development of the Sex Organs - Gonads.

- until end of first trimester, undifferentiated
- male: SRY induces differentiation to testes
- secrete testosterone and Müllerian Inhibiting Factor
- female: default pattern, differentiation to ovaries

# Sexual Development

## Development of the Sex Organs - Internal Ducts.

- 2 sets of ducts
- Male:
  - testosterone induces Wolffian duct
- MIH actively breaks down Müllerian duct
- Female:
- default pattern, Müllerian ducts differ

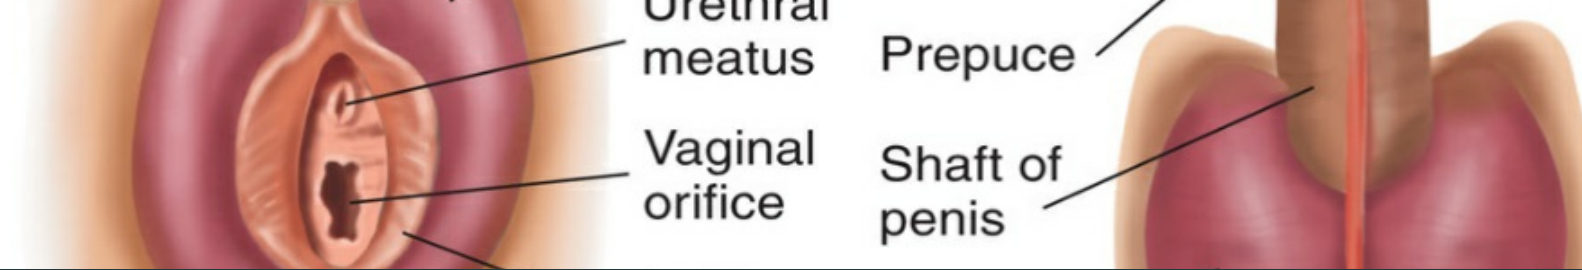

system

# Sexual Development

## Development of the Sex Organs - External Genitalia.

- 1 pluripotential anlage for external organs
- male:
- dihydrotestosterone induces pluripotential anlage to develop into male genitalia
- female:
- default pattern, pluripotential genitalia develop into female genitalia

# Sexual Development

Sexual Differentiation.

# Sexual Development

## Sexual Differentiation.

- masculinization and defeminization of 1
- female follows default genetic program

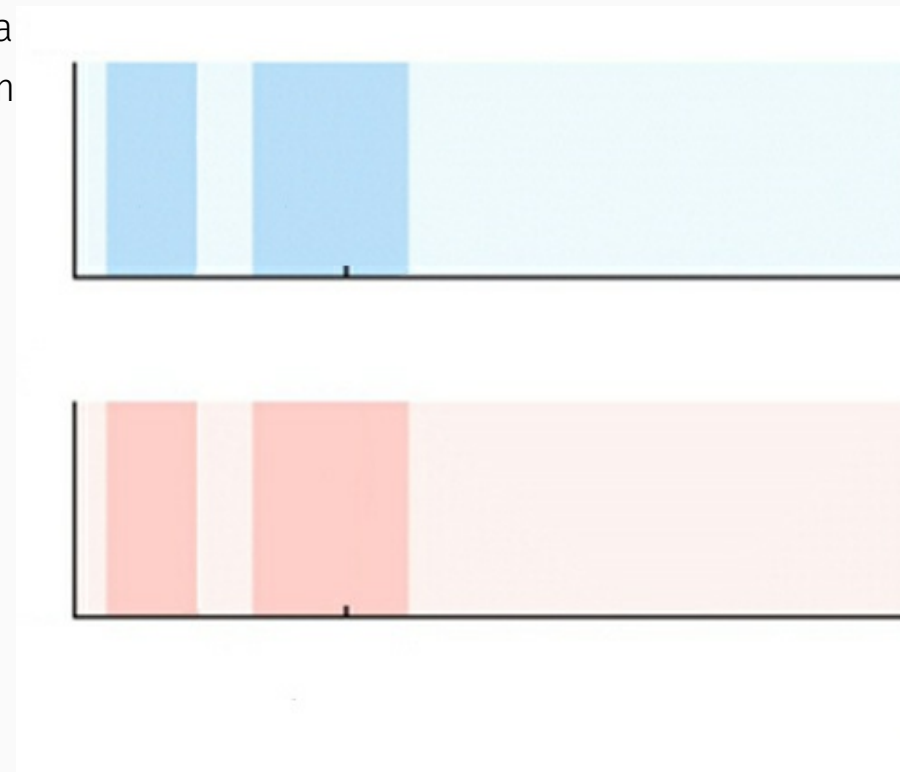

**Human Serum Relative Levels**

# Sexual Development

## Sexual Differentiation.

- masculinization of brain mechanisms a
- female follows default genetic program

# Sexual Development

## Gonadal and Adrenal Hormones.

- steroids, derived from cholesterol
- lipophilic
- actions mostly through intracellular receptors

(B) Steroid hormone action

**BIOLOGICAL PSYCHOLOGY 7e, Figure 5.8 (Part 2)**

# Sexual Development

## Gonadal and Adrenal Hormones.

- testosterone (androgen)
- some effects mediated through testosterone
- some effects mediated through 5 $\alpha$ -dihydrotestosterone
- some effects mediated through estradiol

# Sexual Development

## Gonadal and Adrenal Hormones.

- so, why aren't female fetuses masculinized
- extracellular estradiol bound by f-fetoprotein
- extracellular androgens not bound by f-fetoprotein

# Sexual Development

## Masculinization and Defeminization.

- meiotic nondisjunction
- Turner, Klinefelter, and Triple X syndromes

# Sexual Development

## Masculinization and Defeminization.

- Complete Androgen Insensitivity Syndrome
- XY; testes
- non-functioning androgen receptor
- feminized physical appearance and brain
- gender identity = female
- sexual partner preference = male

# Sexual Development

## Masculinization and Defeminization.

- Congenital Adrenal Hyperplasia (CAH)
- XX; ovaries
- defect in glucocorticoid (cortisol) synth
- excess androstenedione
- variable degrees of masculinization
- gender identity = female or male
- sexual partner preference = female or male

# Sexual Development

## Sexual Maturation - Puberty.

- hypothalamic surges of GnRH and CRH
- stimulates FSH, LH, ACTH → steroid hormones
- androgens/estrogens → secondary sex characteristics
- gonadal steroids (T, DHT, P, E)
- adrenal steroids (androstenedione)
